laserdata

Prepared for **Attentive**

Real-time subscriber decisions for Attentive, on LaserData.

Every shopping event reaches the one worker that owns its subscriber, in order and in milliseconds, so **a burst of cart updates queues one text**, with no Redis lock. It runs beside Pulsar, so nothing else has to move.

One shopping burst, one text,
as the event log sees it.
Now multiply by 620M texts on Black Friday.

```
14:03:41.208   add_to_cart        s004182307 · brand-0117 · partition 37 · seq 6
14:03:41.211   text.queued        decide-1 · cart_reminder · +3 ms
14:03:41.522   add_to_cart        decide-1 · seq 7 · held, texted 311 ms ago
14:03:42.010   checkout_started   decide-1 · seq 8 · held
14:03:42.012   send.audit         s004182307 · 1 text · decided by 1 worker
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	With a shared subscription, one subscriber's events "can be consumed concurrently by multiple consumers", so **a user "may receive multiple messages"**. Redis locks stalled at peak; KEY_SHARED still needs a mutual-exclusivity alert (Attentive Tech Blog, Apr 2025).
Where it fits	**The subscriber decision lane:** shopping events keyed by subscriber. Each worker owns its partitions, so one subscriber is decided by one worker, in order, with no lock. Pulsar keeps everything else.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Attentive: **shopping sessions keyed by subscriber**, decision workers that own their partitions, a send-side audit for duplicate texts, a 25,000 texts/s campaign blast next door, and a Pulsar shadow bridge. It prints p99 and duplicate texts every second.

Open the Attentive kit and write-up →

Then a 2–4 week evaluation on mirrored shopping events for a set of brands beside Pulsar, priced per billion events. **No advantage, no migration.**
