laserdata

Prepared for **Character.AI**

Real-time safety verdicts for Character.AI, on LaserData.

Every turn reaches **the trust and safety classifiers, and every verdict reaches every chat server, in milliseconds**, before the next turn. It runs beside WarpStream, so nothing else has to move.

One conversation, one flagged turn,
as the event log sees it.
Now multiply by every conversation.

```
21:07:12.204   turn            conv-0418273  turn 14  chat-03
21:07:12.210   safety.verdict   conv-0418273  turn 14  BLOCK  +6 ms
21:07:12.213   verdict applied  8/8 chat servers  +3 ms
21:07:12.910   turn 15 (swipe)  chat-05, prompt built without turn 14  +0.7 s
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	A **5 GiB/s pipeline captures the full prompt** for real-time trust and safety classifiers, prompt and model A/B tests and the feature store, on WarpStream, at **10–15% of the alternatives' cost**. (WarpStream case study, 2026)
Where it fits	**The verdict lane:** each turn keyed by conversation into the classifiers, block and Lifeline verdicts back to every chat server. WarpStream and the prompt pipeline stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Character.AI: **8 chat servers, 10,000 turns/s**, trust and safety classifiers, an evening surge, a full-prompt flood next door and a WarpStream shadow bridge. It prints your lane's p99 and the next turns served before their verdict every second.

Open the Character.AI kit and write-up →

Then a 2–4 week evaluation on one mirrored turns topic, alongside WarpStream. **No advantage, no migration.**
