laserdata

Prepared for **Verkada**

Real-time alarm triggers and disarms for Verkada, on LaserData.

Every camera detection and badge disarm reaches **the alarm state in milliseconds**, so a disarm in time always cancels the alarm. It runs beside Kafka and Temporal, so nothing else has to move.

One camera partition, one arrival,
as the event log sees it.
Now multiply by every site.

```
07:58:12.204   camera.detect   site-004182/cp1  seq 5531  person   entry delay 30 s
07:58:39.871   access.disarm   site-004182/cp1  seq 5534  badge, front door
07:58:39.879   alarm.state     site-004182/cp1  disarmed, countdown cancelled  +8 ms
07:58:42.204   entry delay would have run out here: nothing raised, nobody called
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Low-latency, high-availability backend services** that orchestrate alarm detection and response, on **Kafka, Temporal and Postgres**. Camera partitions arm and disarm through the cloud, and a badge at a configured door disarms them. (Verkada Alarms job post and help center, 2026)
Where it fits	**The camera partition alarm lane:** detections, disarms, arms and panic presses keyed by partition into the alarm state, raised alarms out to monitoring agents and the response workflows. Kafka, Temporal and Command stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Verkada: **200,000 camera partitions**, camera detections, badge disarms, arms and panic presses, an alarm state service with entry delays, a morning-opening peak, camera analytics next door and a Kafka shadow bridge. It prints your lane's p99 and the false alarms from late disarms, every second.

Open the Verkada kit and write-up →

Then a 2–4 week evaluation on one mirrored alarm event topic, alongside Kafka and Temporal. **No advantage, no migration.**
