laserdata

Prepared for **Discord**

Real-time Osprey actions for Discord, on LaserData.

Every action reaches the rules worker that owns its user, in order and in milliseconds, so **a spammer label is in place before that user's next message**. It runs beside Pub/Sub or Kafka, so nothing else has to move.

One spam run, one label,
as the event log sees it.
Now multiply by 400M actions a day.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Osprey handles **~400 million actions a day**: 204 action types, 2,288 rules, ~500 rules per action. Actions arrive by gRPC or through a message queue, and the coordinator balances them across rules workers (Discord Engineering, Feb 2026).
Where it fits	**The Osprey action lane:** async actions keyed by user. Each rules worker owns its partitions, so one user's actions are evaluated in order and a LabelAdd is in place before the next one. The gRPC path and your queue stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Discord: **Osprey-shaped actions keyed by user**, with spam runs from fresh accounts, rules workers that own their partitions, an effect-side audit, a search reindex backfill next door, and a Pub/Sub shadow bridge. It prints p99 and messages let through after the label every second.

Open the Discord kit and write-up →

Then a 2–4 week evaluation on mirrored Osprey actions beside your queue, priced per billion events. **No advantage, no migration.**
