laserdata

Prepared for **Braze**

Real-time Currents connectors for Braze, on LaserData.

Every Currents connector gets its own Apache Iggy topic, so **a partner outage delays only that connector**, which resumes from its own offset with nothing lost. It runs beside Kafka, so nothing else has to move.

One partner down, every other connector on time,
as the event log sees it.
Now multiply by every integration.

14:00:00.000	partner.down	app-0002-storage · offset held at 8,412,077
14:03:41.208	Purchase	app-0117 · user u00418230 · seq 12
14:03:41.217	exported	app-0117-analytics · +9 ms
14:05:00.000	partner.up	app-0002-storage · 272,400 waiting on its own topic
14:06:06.400	caught.up	app-0002-storage · from offset 8,412,077 · 0 lost

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Currents handles tens of billions of messages a day** on Kafka (Braze job post). On 31 Jul 2026, up to ~5% of EU02 connectors built backlogs while "appearing in a healthy state in our monitoring system" (Braze status page).
Where it fits	**The Currents connector lane:** engagement events on one topic per connector, keyed by user ID. Each connector reads at its partner's rate from its own offset; its backlog is read from the log. Kafka keeps the event-type topics and the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Braze: **255 Currents connectors on their own topics**, a router with per-connector event settings, sharded connectors with partner rate limits, a partner outage, the event firehose next door, and a Kafka shadow bridge. It prints every connector's p99 and backlog every second.

Open the Braze kit and write-up →

Then a 2–4 week evaluation on mirrored Currents traffic for a set of connectors beside Kafka, priced per billion events. **No advantage, no migration.**
