laserdata

Prepared for **Last9**

Real-time streaming aggregation for Last9, on LaserData.

Every raw sample reaches **the streaming aggregator that owns its shard key in milliseconds, and every timeslice closes exact**. It runs beside your gateways and storage, so nothing else has to move.

One series in one timeslice,
as the event log sees it.
Now multiply by millions a minute.

```
14:22:33.120   sample     prod-03 checkout le=0.25  seq 43  18,547
14:22:33.124   applied    aggregator-2  partition 11  +156  +4 ms
14:22:34.231   sample     seq 42 (retry)  18,391  +0, counted once
14:23:02.003   aggregate  checkout le=0.25  14:22  = gateway count, exact
```

From the creators of Apache Iggy

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Samples sharded by cluster, metric and shard_label; **"extremely high cardinality data can be sent to Streaming Aggregators, which provide an almost 100x cardinality boost."** 1M samples/s, swings of 100k to 300M a minute. (Last9 blog, Aug 2023; Altinity webinar, May 2026)
Where it fits	**The streaming aggregation lane:** raw samples keyed by shard key into the aggregator that owns them, every timeslice checked exact. Gateways, storage and Control Plane rules stay.
Next	**TraceMetrics and log-to-metric rules** on the same lane, rebuilt from the log on restart.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Last9: **4 clusters, 96,000 series scraped every 15 s**, a sum2 rule over 60 s timeslices, retries and counter resets on purpose, a rollout, a raw-log flood and an OTLP shadow tee. It prints your lane's p99 and timeslices checked exact every second.

Open the Last9 kit and write-up →

Then a 2–4 week evaluation on one mirrored aggregation rule, beside your gateways. **No advantage, no migration.**
