laserdata

Prepared for **MPL**

Real-time player form for MPL matchmaking, on LaserData.

Every finished game reaches **every matchmaker in milliseconds**, so a losing streak gets an easier match on the next tap of Play again. It runs beside Confluent Cloud, so nothing else has to move.

One player, one losing streak,
as the event log sees it.
Now multiply by every player.

```
21:14:07.400   game.result          P04417520   pool · loss · streak −3 · seq 212
21:14:07.404   matchmaker.form      P04417520   seq 212 applied
21:14:10.100   match.request        P04417520   lobby pool · Play again
21:14:10.104   matchmaker: streak −3 · protected · opponent at 1,036
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Stale matchmaking data "caused some players to experience losing streaks".** Results stream into Confluent Cloud to spot a streak and give the next game a better chance of a win; ML decisions run at p99 under 10 s. (Confluent, 2023; Current India 2025)
Where it fits	**The player form lane:** rating and streak after every game, keyed by player, read by every matchmaker. Confluent Cloud, Flink and the feature store stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for MPL: **100,000 players in 16 lobbies**, Elo-rated games, matchmakers with streak protection, a live-match surge, an app-events neighbour and a Confluent Cloud shadow bridge. It prints your lane's p99 and losing streaks missed, every second.

Open the MPL kit and write-up →

Then a 2–4 week evaluation on one mirrored game-results topic, alongside Confluent Cloud. **No advantage, no migration.**
