laserdata

Prepared for **CrowdStrike**

Real-time identity enforcement for CrowdStrike, on LaserData.

Every authentication reaches **the identity detection engine, and every block reaches every domain controller, in milliseconds**, before the account's next logon. It runs beside Kafka, so nothing else has to move.

One stolen credential,
as the event log sees it.
Now multiply by every account you protect.

```
14:02:07.000   auth.ntlm      u031877  dc-03  ws-48213 → srv-2207, a new host
14:02:07.120   auth.ntlm      u031877  dc-06  12th in 1 s, 10th host
14:02:07.124   identity.enforce  u031877  BLOCKED (lateral movement)  +4 ms
14:02:07.128   block applied  8/8 DCs, before the account's next logon  +4 ms
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Identity Protection runs detection over Kafka streams, **"maintaining sub-second detection latency"**, and is moving it to event-streaming microservices. Policy rules block or require MFA on identity detections. Fastest breakout: 27 seconds. (CrowdStrike job post, Tech Hub and 2026 Global Threat Report)
Where it fits	**The identity lane:** authentications keyed by account into detection, blocks back to every DC sensor. The Kafka firehose, Flink, LogScale and your rules stay.
Next	**AI agents** triage on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for CrowdStrike: **8 DC sensors, 100,000 accounts, 10,000 authentications/s**, a detection engine, planted lateral movement and compromised passwords, an endpoint-telemetry flood next door and a Kafka shadow bridge. It prints your lane's p99 and attacker logons let through after a block every second.

Open the CrowdStrike kit and write-up →

Then a 2–4 week evaluation on one mirrored authentication-events topic, alongside Kafka. **No advantage, no migration.**
