laserdata

Prepared for **Chewy**

Fulfillment center events at the edge for Chewy, on LaserData.

Every carton event lands in **a log inside the building in milliseconds** and reaches AWS in order, once, even when the link drops. It runs beside the WMS, so nothing else has to move.

One carton in one building,
as the event log sees it.
Now multiply by every carton.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Fulfillment Technology is hiring to build the next WMS **"across cloud and edge environments"** and **"maintain warehouse operations through failures and disruptions"**, event-driven with retry and replay, and keep an event history that can be **"traced, explained, reconciled"**. Over 50% of volume now ships from automated sites. (Chewy job posting, Oct 2026; Q2 FY26 call)
Where it fits	**The FC edge lane:** one small log per building for carton events, read by the floor in milliseconds and forwarded to AWS in order. The WMS, controls and cloud stay.
Next	**Robotics and WCS task events** on the same building log, with replay after a restart.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Chewy: **one building, six events per carton** from pick to ship-confirm, handheld retries sent twice, conveyor and sorter telemetry next door, and **the link to AWS cut mid-run**. It prints the floor's p99, events held and drained, and AWS reconciled against the building.

Open the Chewy kit and write-up →

Then a 2–4 week evaluation in one building on mirrored carton events, beside the WMS. **No advantage, no migration.**
