laserdata

Prepared for **AWeber**

Real-time Imbi notifications for AWeber, on LaserData.

Every deployment and mention reaches **slackbot and email in milliseconds, posted once**, and a stalled reader is flagged in seconds. It runs on the Iggy server Imbi already has, so nothing else moves.

One deployment, two readers,
as the event log sees it.
One reader stalls on purpose.

```
15:42:07.412   deployment   mail-renderer   Deployed 4.12.0, production
15:42:07.415   slackbot     posted to #deploys · re-sent copy skipped
15:42:10.240   watchdog     STALL email: 214 waiting, 3.2 s unmoved
15:42:12.903   email        back from its own position · 0 missing, 0 twice
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Imbi moved its ClickHouse writes onto Apache Iggy and names **a notifications stream next: deployments and mentions to slackbot and email.** A sink group kept a gone member and polled empty, with no error, for six days. (ADR 0019, Sep 2026; apache/iggy #4273 and #4279, Sep 2026)
Where it fits	**The notifications lane:** deployment and mention events keyed by project or user, read directly by slackbot and email, with a lag watchdog. The ClickHouse sink path stays.
Next	**Imbi's agent tasks** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for AWeber: **Imbi services publishing 200 deployment and mention notifications/s** with a 5× release wave and 1% published twice, slackbot and email readers, a stall injected into email, Imbi's analytics rows next door and a read-only bridge from operations_log. It prints each reader's p99, duplicates skipped and every stall flag, every second.

Open the AWeber kit and write-up →

Then a 2–4 week evaluation on Imbi's notifications stream, alongside the ClickHouse sink. **No advantage, no migration.**
