laserdata

Prepared for **The New York Times**

Every publish on every serving node for The New York Times, on LaserData.

Every new version of every article reaches **every serving node in milliseconds**, inside the one-second publish SLA, even while a tag change republishes thousands. It runs beside Kafka, so the Monolog stays.

One correction, one tag change, one node added,
as the event log sees it.
Now multiply by the whole live desk.

21:04:07.300	asset.published	nyt://article/5c6de776 · correction · v38
21:04:07.304	node.applied	node-1 … node-12 · +4 ms · v38 served
21:04:07.600	tag.updated	Elections · 20,000 articles republished
21:04:08.200	node.rebuilt	node-13 · latest version of every asset

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**"One second after the editor clicks publish, the latest version has to be available on the site."** A changed tag republishes every asset that references it. "I don't particularly want to manage Kafka if we don't have to." (Boerge Svingen, 2017)
Where it fits	**The publish-to-site lane:** every version keyed by asset URI, read by every serving node with its own offsets, kept for a news day. The Gateway, the Monolog and the denormalizer stay on Kafka.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, managed on Google Cloud or in your own GCP account.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for The New York Times: **400 assets on the live desk**, a tag change republishing 20,000 articles on the same lane, a serving node added mid-run and a read-only shadow bridge on the denormalized log. It prints your lane's p99 and the one-second SLA every second.

Open the New York Times kit and write-up →

Then a 2–4 week evaluation on one mirrored denormalized log, beside Kafka. **No advantage, no migration.**
