laserdata

Prepared for **Together AI**

Real-time GPU node health for Together AI, on LaserData.

Every passive health signal reaches **the health checker, and every hold reaches every placement scheduler, in milliseconds**, before the next placement. It runs beside your control plane, so nothing else has to move.

One node, one GPU, one fault,
as the event log sees it.
Now multiply by tens of thousands of GPUs.

```
14:32:08.210   node.signal   gpu-node-01734   DmesgGpuFallenOffBus   GPU 3, Xid 79
14:32:08.214   node.health   gpu-node-01734   HOLD   recommend migrate   +4 ms
14:32:08.217   hold applied   8/8 placement schedulers   +3 ms
14:32:08.600   new replica   placed on gpu-node-00912, not 01734   +0.4 s
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Passive health checks on every node raise **Xid, ECC, fallen-off-bus and InfiniBand signals**; each maps to a repair action that **waits for approval**. Your compute team wants health and remediation **event-driven on Kafka or NATS, not polled**. (Together AI blog, docs and job postings)
Where it fits	**The node health lane:** each node's signals keyed by node into one checker, holds with the repair action back to every placement scheduler. Kubernetes, Temporal and the repair flow stay.
Next	**Fleet intelligence agents** diagnose and correlate failures on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Together AI: **4,000 GPU nodes, 8 placement schedulers**, a health checker with your signal names and repair actions, planted node faults, a GPU telemetry flood next door and a Kubernetes shadow bridge. It prints your lane's p99 and the replicas placed on a node after its hold every second.

Open the Together AI kit and write-up →

Then a 2–4 week evaluation on one cluster's node signals, read-only, beside your control plane. **No advantage, no migration.**
