laserdata

Prepared for **Kalshi**

Real-time order groups across Kalshi's shards, on LaserData.

Every fill on every shard counts toward **one rolling 15-second limit per order group**, and every trigger reaches every shard in milliseconds. It runs beside the engines and Kafka, so nothing else has to move.

One order group on two shards,
as the lane sees it. Neither shard alone is over the limit.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Order groups cancel every resting order** once fills pass a contracts limit in a rolling 15 seconds. Since sharding (Aug to Oct 2026), Combos, Crypto and Sports run on their own matching engines, and order groups do not function across exchange instances. (Kalshi API docs and changelog)
Where it fits	**The order group lane:** fills keyed by order group from every shard into one tracker, and triggers and resets back to every shard. The engines, collateral checks and Kafka stay.
Next	**AI agents** that make markets on Kalshi read the same fills and group states, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, written in Rust, with Go and Rust SDKs.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Kalshi: **20,000 order groups at 8,000 fills a second across four shards**, a burst for a game's final minutes, a trade export next door and a Kafka shadow bridge. It prints your lane's p99, the triggers no single shard could see, and contracts filled past the trigger, every second.

Open the Kalshi kit and write-up →

Then a 2–4 week evaluation on one mirrored fills feed, beside your matching engines. **No advantage, no migration.**
