laserdata

Prepared for **Rivian**

Real-time vehicle state for the Rivian app, on LaserData.

Each vehicle's charge, locks, closures, cabin temperature and position reach **the latest-state service the app reads in milliseconds**, with 5,500+ signals per report flowing next to it. It runs beside MSK, so nothing else has to move.

One R1S, one evening at home,
as the event log sees it.
Now multiply by 150,000 vehicles reporting every 5 seconds.

21:14:00.000	vehicle.report	7PDS00041726 · #8,414 · locked · plugged in · 38.2%
21:14:05.000	vehicle.report	7PDS00041726 · #8,415 · charging · 11 kW · 38.2%
21:14:05.009	state.applied	+9 ms · 11 app signals of the report's 5,500+
21:14:06.240	app.read	shows report #8,415 · Locked · Charging · 38% · 130 mi

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**150,000+ vehicles** send 5,500+ signals every 5 s. Your telematics service keeps each sensor's latest state in Redis for the mobile app, at under 100 ms. (re:Invent 2023; RV Tech, 2025)
Where it fits	**The vehicle state lane:** only the signals the app shows, keyed by vehicle, into the latest-state service. MSK, Flink, Event Watch and the data lake keep the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Rivian: **150,000 vehicles reporting every 5 s**, a latest-state service with every app open checked against the truth, a 2× evening plug-in, the full signal stream next door and an MSK shadow bridge. It prints your lane's p99 every second.

Open the Rivian kit and write-up →

Then a 2–4 week evaluation on one mirrored telemetry topic, alongside MSK. **No advantage, no migration.**
