laserdata

Prepared for **Swiggy**

Real-time rider location and ETAs for Swiggy, on LaserData.

Every delivery partner's location ping reaches **the tracking screen and the last-mile ETA in milliseconds**, even in the Friday dinner rush. It runs beside Confluent, so nothing else has to move.

One delivery partner, one last mile,
as the event log sees it.
Now multiply by every partner on the road.

```
20:01:12.660   order.picked_up   order 183447201 · DE041726
20:06:41.204   partner.ping      DE041726 · #81 · 12.9181, 77.6233
20:06:41.216   tracker.applied   +12 ms · 6 km/h over the last 6 pings
20:06:42.003   eta.updated       order 183447201 · 7 → 9 min, from ping #81
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Your last-mile ETA is built from **delivery partner pings**, refreshed at fixed intervals. In 2022, 4 minutes of offline partitions took down 18 services. (Swiggy Bytes)
Where it fits	**The ping lane:** partner location keyed by partner ID, read by the tracking screen and the last-mile ETA. Confluent keeps orders, payments and the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Swiggy: **60,000 partners pinging every 5 s**, a last-mile ETA service, a 3× dinner rush, a 100× retry storm next door and a Confluent shadow bridge. It prints your lane's p99 every second.

Open the Swiggy kit and write-up →

Then a 2–4 week evaluation on one mirrored ping topic, alongside Confluent. **No advantage, no migration.**
