laserdata

Prepared for **Postman**

Real-time witness ingest for Postman Insights, on LaserData.

Every batch your Insights Agents upload reaches **witness_assembler in milliseconds, and a batch that never arrived is named** by agent and number. It runs beside Kafka, so nothing else has to move.

One agent's uploads,
as the event log sees it.
Now multiply by every pod.

```
14:22:05.031   lane.published     cli_00042  identity-service  batch 118
14:22:05.035   assembler          batch 118, 412 witnesses  +4 ms
14:22:10.000   witness_uploaded   batch 119, 398 witnesses  HTTP 429, lost
14:22:15.037   assembler          batch 120 assembled; cli_00042 batch 119 missing
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Agents upload a batch **every 5 s** to async_witnesses, which publishes to **Kafka** for witness_assembler and ClickHouse. You now time every stage and close the witness funnel arithmetically; a failed upload leaves "the batch that never arrived invisible on both sides". (Insights agent and shared libs on GitHub, Aug–Sep 2026)
Where it fits	**The witness lane:** each upload batch keyed by service, async_witnesses to witness_assembler, numbered per agent. Agents, ClickHouse and the Insights views stay.
Next	**AI agents** read the same lane to explain an endpoint's new errors as they happen, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Postman: **300 agents on 60 services, a batch from each every 5 s, 5,000 witnesses/s** (~3B a week), lost uploads and retried publishes, a busy hour, an agent-telemetry flood next door and a Kafka shadow bridge. It prints your lane's p99 and the witness funnel every second: assembled, missing batches named, duplicates absorbed.

Open the Postman kit and write-up →

Then a 2–4 week evaluation on one mirrored witness topic, alongside Kafka. **No advantage, no migration.**
