laserdata

Prepared for **Middleware**

Real-time cluster commands for Middleware OpsAI, on LaserData.

Every kubectl command OpsAI sends reaches the agent in that cluster **in milliseconds**, the reply comes back inside its deadline, and an Auto Fix that misses its deadline never runs late. It runs beside Pulsar, so nothing else has to move.

One Auto Fix that came too late,
as the command lane sees it.
Now multiply by every cluster.

14:02:11.204	kubectl.request	get pods -n checkout on the agent +3 ms
14:02:11.391	kubectl.reply	ok, kubectl 180 ms back to OpsAI +2 ms
14:02:14.300	kubectl.request	set resources deploy/checkout-api write
14:02:44.300	opsai.gave_up	no reply by the deadline: on-call takes it
14:02:51.870	kubectl.reply	expired, not run: 7.6 s past its deadline

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	OpsAI reaches each cluster through Pulsar. **One slow kubectl stalled every request queued behind it**, so a burst of callers timed out; colliding request IDs left callers **waiting on replies that had arrived** (synthetics-agent and mcp-kubernetes, 2026).
Where it fits	**The OpsAI command lane:** kubectl requests keyed by cluster, replies matched by request ID, each deadline checked before a command runs. Synthetic checks, Pulsar and your ingest path stay.
Next	**OpsAI** keeps every command and reply on the same log, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Middleware: **2,000 clusters**, 300 investigations open, Auto Fix writes, slow log reads, agents that drop off and come back, a 10× customer log burst next door and a Pulsar shadow bridge. It prints the lane's p99 every second and checks that no command runs past its deadline.

Open the Middleware kit and write-up →

Then a 2–4 week evaluation on a mirror of the OpsAI command topics, beside Pulsar. **No advantage, no migration.**
