laserdata

Prepared for **Angel One**

Real-time chart candles for Angel One, on LaserData.

Every price tick reaches **the candle builders on AWS in milliseconds**, so the 1-minute candle is ready long before today's ~1 s. It runs beside Kafka and MirrorMaker, so nothing else has to move.

One scrip, one minute closing,
as the event log sees it.
Now multiply by every scrip.

09:15:59.912	tick	SBIN-EQ · scrip 3045 · ₹812.35 · NSE
09:15:59.916	candle.upsert	09:15 SBIN-EQ · close ₹812.35 · +4 ms
09:16:00.006	candle.final	09:15 · every scrip · 6 ms after the minute
09:16:00.006	dr.match	Hyderabad builder, rebuilt from the log · same candles

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Charts are a **Tier 1 service**. Ticks leave the on-premise price capture through Kafka and MirrorMaker to AWS, and the delay from tick to chart is **p50 ~550 ms, p99 ~1,000 ms**; you are "working on several other projects to improve the ingestion delays". (Angel One tech blog)
Where it fits	**The candle lane:** price ticks keyed by scrip code, from the price capture into every candle builder on AWS, kept for rebuilds and a DR builder. Kafka, MirrorMaker and Aurora stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Angel One: **40,000 scrips at 20,000 ticks/s** with your tick fields and candle math, a 09:15 burst, a DR builder that must match candle for candle, an order-event burst next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the Angel One kit and write-up →

Then a 2–4 week evaluation on one mirrored tick topic, alongside Kafka. **No advantage, no migration.**
