laserdata

Prepared for **Pocket FM**

Real-time Autoplay queues for Pocket FM listeners, on LaserData.

Every play, skip and unlock reaches the listener's Autoplay queue **in milliseconds, so the next show is never one they just skipped**. It runs beside your Kafka and Redis, so nothing else has to move.

One listener, one skip, one next show,
as the event log sees it.
Now multiply by a hit's new episodes.

22:41:06.240	action.skip	U0731204488 · The Eclipse Princess · Autoplay pick
22:41:06.246	queue.applied	seq 12 · dropped · next: Seventh Seal · +6 ms
22:41:06.900	autoplay.request	end of content · needs seq 12
22:41:06.903	autoplay.next	Seventh Seal · episode 1

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Autoplay picks the next show from **"what they listen to, skip, or complete"**; the playlist is routed through Apache Kafka into Redis and **"updates daily"** (Pocket FM, 2025). It is the end-of-content queue, with its own revenue line (2026).
Where it fits	**The Autoplay lane:** each action keyed by listener, applied to the queue before the next end-of-content pick. Kafka, Redis and the daily model stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Pocket FM: **1,000,000 listeners in session and 20,000 listening actions a second**, skips and unlocks, a 2× new-episode surge, analytics next door and a read-only Kafka bridge. It prints your lane's p99 and stale Autoplay picks every second.

Open the Pocket FM kit and write-up →

Then a 2–4 week evaluation on one mirrored listening-actions stream, beside your Kafka. **No advantage, no migration.**
