laserdata

Prepared for **Dhan**

Real-time order updates for Dhan's apps and APIs, on LaserData.

Every DEXT order update reaches **every gateway in milliseconds**, and a socket that reconnects gets what it missed, in order. It runs beside DEXT.

One trader's phone drops for a second,
as the event log sees it.
Now multiply by the 9:15 open.

```
09:15:01.610  PENDING      seq 87     NIFTY 24500 CE · Super Order entry, buy 75 of 150
09:15:02.040  TRADED       seq 88–90  150 of 150 at 182.40 · stop-loss 176.90, target 189.70 live
09:15:02.500  login        1000418207    resume after seq 86
09:15:02.504  gateway: 87–90 replayed from the log, in order · then live
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**95% of orders under 25 ms through DEXT**, 150+ risk checks per order, active-active across sites, and a hundredfold jump in concurrent customers at the open (AWS). Order updates from TRANSIT to TRADED, Super Order legs included, on the app, web and DhanHQ sockets (DhanHQ docs).
Where it fits	**The live order update lane:** DEXT's status changes keyed by client ID, read by every order update gateway, replayed by offset on reconnect. DEXT, Aurora and the order path stay.
Next	**Your support assistant** on Bedrock answers "what happened to my order?" from the same updates, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, written in Rust: no JVM and no GC pauses in the lane.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Dhan: **300,000 clients at 10,000 order updates a second**, Super Orders with stop-loss and target legs, gateways with sockets dropping and reconnecting, a 9:15 burst, a compliance export next door and a bridge from the DhanHQ order update socket. It prints your lane's p99 and the updates replayed to reconnecting sockets, with gaps, every second.

Open the Dhan kit and write-up →

Then a 2–4 week evaluation on one mirrored order update feed, beside DEXT and your gateways. **No advantage, no migration.**
