laserdata

Prepared for **Zeta**

Real-time account spend for Zeta's Tachyon feature store, on LaserData.

Each card approval and reversal reaches the feature store **in milliseconds, so the next authorization checks category limits against current spend**. It runs beside your Kafka, so nothing else has to move.

One family card account, three dining bills,
as the event log sees it.
Now multiply by 2 million a day.

19:42:05.318	auth.approved	add-on A02 · dining · ₹4,200 · limit ₹10,000 a day
19:42:05.324	spend.updated	seq 7 · dining ₹4,200 · +6 ms
19:42:06.904	auth.check	A02 · ₹3,900 · sees seq 7 → approved, ₹8,100
19:42:08.512	auth.check	A02 · ₹3,600 · ₹11,700 > ₹10,000 → declined

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Tachyon's feature store tracks **"real-time spend for each account"** by MCC, category, merchant or card, and primary cardholders set **spend limits on categories** across family add-on cards. (zeta.tech)
Where it fits	**The spend lane:** each approval and reversal as the account's resulting spend, keyed by account, read by the feature store. In shadow first; the switch, Kafka and Atropos stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Zeta: **250 authorizations a second, add-on card runs into category limits, reversals and a 4× peak**, a decision-engine check, an event stream next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the Zeta kit and write-up →

Then a 2–4 week evaluation on one tenant's mirrored authorization outcomes, self-hosted beside your Kafka. **No advantage, no migration.**
