laserdata

Prepared for **Honeycomb**

Real-time ingest freshness for Honeycomb triggers, on LaserData.

Every enqueued batch and every Retriever's progress reach the freshness check in milliseconds, so **a heartbeat trigger pages when a customer goes quiet, not when Retriever is behind**. It runs beside Kafka, so nothing else has to move.

One dataset, one cutover,
as the event log sees it.
Multiply by every dataset.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	In the May 2026 Kafka cutover, ingest kept accepting but **recent data was not queryable for 25 min to 1.5 h**, and heartbeat alerts fired. Your follow-up: keep missing-data alerts quiet during maintenance. (Incident reports, Feb and Jun 2026)
Where it fits	**The ingest freshness lane:** a receipt per enqueued batch, keyed by dataset, and Retriever progress per Kafka partition. Events, Retriever, SLOs and the Kafka cluster stay as they are.
Next	**AI agents** ask the same lane whether recent data is complete before they answer, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Honeycomb: **40,000 datasets sending a batch a second**, customers going quiet, Retriever falling behind on 30% of Kafka partitions, every heartbeat verdict checked against the truth, a backfill next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the Honeycomb kit and write-up →

Then a 2–4 week evaluation on one environment's receipts, alongside Kafka. **No advantage, no migration.**
