laserdata

Prepared for **Alpaca**

Real-time trade events for Alpaca's Broker API partners, on LaserData.

Every trade event reaches **each partner in milliseconds**; a reconnect resumes at its exact event_id and a slow reader loses nothing. It runs beside Redpanda.

One partner's stream drops for a second,
as the event log sees it.
Now multiply by 300+ partners.

```
09:30:01.610   partial_fill      seq 41     7c1e…a42 · AAPL buy, 1.2000 of 2.4183 at 228.41
09:30:02.040   fill              seq 42–43  2.4183 at avg 228.43 · rebalance VTI buy new
09:30:02.500   reconnect         corr-01    since_id=01JBX4N6…K7Q (seq 40)
09:30:02.504   gateway: 41–43 from the log, exactly once, in order · then live
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**95% of orders under 5 ms through OMS v2**, with its write-ahead log on Redpanda, read by other services (Alpaca blog). Partner streams resume by since_id; slow readers get "dropped N messages" (Broker API docs). 300+ partners.
Where it fits	**The partner trade event lane:** OMS trade events in one log per partner, keyed by account ID, resumed by offset; big partners get more partitions. The OMS and Redpanda stay.
Next	**Your agent-first brokerage:** agents acting on partner accounts read the same trade events, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, written in Rust: no JVM and no GC pauses in the lane.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Alpaca: **1,000,000 accounts across six partners at 10,000 trade events a second**, a robo-advisor rebalance burst, partners disconnecting and resuming by event_id, one partner reading slowly, and a bridge from the Redpanda WAL. It prints each gateway's p99, the resumes and the slow partner's lag, with gaps, every second.

Open the Alpaca kit and write-up →

Then a 2–4 week evaluation on one mirrored partner's trade events, beside the OMS and Redpanda. **No advantage, no migration.**
