laserdata

Prepared for **Roku**

Live price floors for the Roku Exchange, on LaserData.

Every auction outcome reaches **the floor service, and every new floor reaches every exchange node, in milliseconds**, even in a live game's ad break. It runs beside Kafka, so nothing else has to move.

One inventory segment in a live game,
as the event log sees it.
Now multiply by every segment.

```
20:31:01.244   auction.outcome   sports/roku-tv/mid1   x-03   5 bids   top $21.40
20:31:01.250   floor.update      sports/roku-tv/mid1   $17.80   +6 ms
20:31:01.256   floor applied     8/8 exchange nodes, before their next auction   +6 ms
20:31:03.600   auction.outcome   sports/roku-tv/mid1   x-05   1 bid    $19.60 → pays $17.80
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	The Roku Exchange prices every impression in real time across **100M+ household devices**, with **dynamic floors on real-time signals such as demand density**. Your data stack runs Kafka and Flink. (Roku job posts, Oct 2026)
Where it fits	**The floor lane:** auction outcomes keyed by inventory segment into the floor service, new floors back to every exchange node. Kafka, Flink and Spark stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Roku: **8 exchange nodes, 400 inventory segments, 10,000 auctions/s**, a floor service, live-game ad breaks, an impression log next door and a Kafka shadow bridge. It prints your lane's p99 and RPM against a slower floor refresh every second.

Open the Roku kit and write-up →

Then a 2–4 week evaluation on one mirrored auction-log topic, alongside Kafka. **No advantage, no migration.**
