laserdata

Prepared for **Razorpay**

Real-time payment downtime signals for Razorpay Checkout, on LaserData.

Payment outcomes reach your downtime detector, and its signals reach Checkout, **in milliseconds, so a failing method is hidden the moment it is flagged**. It runs beside MSK, so nothing else has to move.

One downtime on match night,
as the event log sees it.
Now watch 50+ cohorts, every second.

20:41:07.200	payment.failed	upi:psp:okhdfcbank · first of 22 failures in 40
20:41:07.750	downtime.started	upi:psp:okhdfcbank · seq 7 · SR 45% · medium
20:41:07.755	checkout.applied	+5 ms · @okhdfcbank hidden, other UPI apps shown
20:41:07.756	webhook.queued	payment.downtime.started · to merchants

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Over 20,000 payments a month** failed because customers picked a method that was down (2021). Downtime messaging in Checkout is worth **a 0.5–0.6% success-rate bump** (2024).
Where it fits	**The downtime lane:** payment status in, keyed by cohort; downtime signals out to Checkout and webhooks. MSK, the UPI Switch and your detector stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Razorpay: **2,000 payments a second with a 5× surge**, 50 cohorts, injected downtimes, a Checkout that counts late signals, a workflow stream next door and an MSK shadow bridge. It prints both hops' p99 every second.

Open the Razorpay kit and write-up →

Then a 2–4 week evaluation on one mirrored payment-status topic, self-hosted in your AWS account, beside MSK. **No advantage, no migration.**
