laserdata

Prepared for **PhonePe**

Real-time payment velocity features for PhonePe risk checks, on LaserData.

Each payment's new velocity counts reach the risk check **in milliseconds, so the check on a payer's next payment counts the last one**. Self-hosted beside your Kafka, in shadow first, so nothing else has to move.

One payer, three payments in four seconds,
as the event log sees it.
Now multiply by 31 crore a day.

21:04:10.212	payment.completed	P031742290 → new payee · ₹4,999
21:04:10.221	velocity.counted	seq 1 · 1 in 60 s · +9 ms
21:04:12.030	risk.check	payment 2 · counts seq 1 · 2nd new payee in 2 s
21:04:13.871	risk.check	payment 3 · 3 new payees in 4 s → step-up auth

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Fraud checks run **within a few milliseconds** on transaction frequency aggregated in real time, and keeping those variables current was "the first major challenge". (PhonePe blogs, 2022, 2025)
Where it fits	**The velocity lane:** each payment's resulting counts, keyed by payer, read by the store behind the check. In shadow first; Kafka, Aerospike and the payment path stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for PhonePe: **4,200 payments a second with payer bursts and a 3× peak**, a next-payment risk check, an analytics stream next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the PhonePe kit and write-up →

Then a 2–4 week evaluation on one mirrored payments topic, self-hosted beside your Kafka. **No advantage, no migration.**
