laserdata

Prepared for **Conviva**

Real-time ad break alerts for Conviva, on LaserData.

Every ad event reaches **the ad break checker, and every failing ad server reaches ad ops, in milliseconds**, while the break is still running. It runs beside Kafka and Druid, so nothing else has to move.

One session, one break,
as the event log sees it.
Now multiply by 56 million plays.

```
20:41:02.413   ad.response_failure   sess-04172593  slot 1  ad-server-b  dallas  timeout
20:41:02.419   ad.alert             ad-server-b × dallas  unfilled 31% of 212 slots  +6 ms
20:41:02.422   alert delivered      ad ops console, webhooks, agents  +3 ms
20:41:30.402   ad.attempt           sess-04172593  slot 2  backup ad server  +28 s
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Time-State on Kafka and Druid** computed QoE over **3.6 billion events a minute** for 16 million concurrent viewers. SEI now puts video, ads and app on one real-time timeline; on World Cup opening day Nexa found **528,000 unfilled ad breaks**, 59,000 fixable before the next kickoff. (Confluent award, 2024; SEI launch, Oct 2026)
Where it fits	**The live ad break lane:** ad events keyed by session into the ad break checker, cohort alerts out to ad ops, webhooks and agents. Time-State, Kafka, Druid and ClickHouse stay.
Next	**AI agents**, Nexa and your customers' over MCP, act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Conviva: **40,000 sessions on 8 live channels**, each break the same moment for everyone watching, an ad server failing in one market, full-census heartbeats next door and a Kafka shadow bridge. It prints your lane's p99 and the breaks flagged while still running, every second.

Open the Conviva kit and write-up →

Then a 2–4 week evaluation on one mirrored ad events topic, alongside Kafka and Time-State. **No advantage, no migration.**
