laserdata

Prepared for **Glance**

Real-time lock-screen ad caps for Glance, on LaserData.

Every impression and dismiss beacon reaches **every ad server in milliseconds, before that phone's next prefetch refill**, so frequency caps and dismissals hold. It runs beside Kafka, so nothing else has to move.

One phone syncs,
one refill follows.
Now multiply by 300M devices.

```
08:14:02.310   beacons   u-04187733  cmp-012 3/3 · dismiss adv-07
08:14:02.314   applied   on every ad server  +4 ms
08:14:02.540   refill    u-04187733  ad-11 · 3 slots for the next unlocks
08:14:02.541   held      cmp-012 and adv-07 skipped · cmp-031, cmp-005, cmp-019
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Lock-screen ads are **decided in milliseconds, prefetched and sometimes shown offline, with delayed impression beacons**; you own per-user frequency and ad load across all demand sources, on Java and Kafka. (Glance job post, 2026)
Where it fits	**The ad-state lane:** every impression and dismiss, keyed by user, to every ad server before the phone's next refill. Kafka, Spark and Flink stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Glance: **3 ad servers, 500,000 users, 3,000 phone syncs/s** with beacons from offline phones, a sale peak, an interaction-event flood next door, a restart and a Kafka shadow bridge. It prints your lane's p99 and stale placements every second.

Open the Glance kit and write-up →

Then a 2–4 week evaluation on one mirrored beacon topic, alongside Kafka. **No advantage, no migration.**
