laserdata

Prepared for **CoinDCX**

Real-time mark prices for CoinDCX's liquidation engine, on LaserData.

Every mark price and position change reaches **every liquidation worker in milliseconds**, so each batch is checked before the next. It runs beside your feed handler, so nothing else has to move.

One position, one mark batch,
as the event log sees it.
Now multiply by 505 instruments.

```
14:02:07.160   mark.batch          505 marks          B-SOL_USDT mp 99.74 · seq 86412
14:02:07.172   liquidator          U00418207          long 50 SOL @ 103.40, 20x isolated
14:02:07.172   liquidator          U00418207          mark 99.74 ≤ liquidation 99.78
14:02:07.174   order.liquidate filled 99.70 · 4 USDT past · insurance fund untouched
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**A mark batch for ~500 instruments** every second from the partner exchange, landing 150–200 ms after it was sent; tiered maintenance margin, the cross-margin ratio rule and system liquidation orders. (CoinDCX Futures API docs and public prices)
Where it fits	**The mark price lane:** marks keyed by instrument and position changes keyed by account, read by every liquidation worker, rebuilt from the log on restart. The feed handler, matching and order path stay.
Next	**AI agents** that watch risk for traders read the same marks and positions, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for CoinDCX: **505 instruments and 300,000 open positions**, isolated and cross margin with your maintenance tiers, a market crash, a trade export next door and a Kafka shadow bridge. It prints your lane's p99 and the USDT filled past liquidation and bankruptcy prices, every second.

Open the CoinDCX kit and write-up →

Then a 2–4 week evaluation on one mirrored mark feed, beside your feed handler and liquidation engine. **No advantage, no migration.**
