laserdata

Prepared for **Magnite**

Real-time DSP demand for traffic shaping at Magnite, on LaserData.

When a DSP starts or stops bidding on a slice of supply, **every traffic-shaping node knows in milliseconds**, so requests go where bids come back. It runs beside Kafka, so nothing else has to move.

One DSP on one CTV segment,
as the event log sees it.
Now multiply by every pair.

```
21:03:11.927   appetite  dsp-014 × ctv/nyc/30s  bid rate 0.27  seq 4,118
21:03:12.208   appetite  dsp-014 × ctv/nyc/30s  STOPPED       seq 4,119
21:03:12.215   applied   32/32 shaping nodes, before the next request  +7 ms
21:03:12.216   callouts to dsp-014 on ctv/nyc/30s: 0, until it bids again
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Traffic shaping **prioritizes high-value ad requests across ~2 trillion transactions a day**, routing at p99 ≤ 20 ms; a 1% gain touches ~20B a day. Rust and Scala, with Kafka. (Job posts, 2026)
Where it fits	**The DSP appetite lane:** which DSPs are bidding on which supply, from the exchange to every shaping node, rebuilt from the log when a pod starts. Kafka, Spark and Aerospike stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Magnite: **60 DSPs × 5,000 supply segments, 20,000 appetite changes/s**, shaping nodes that rebuild from the log, an auction-log flood next door and a Kafka shadow bridge. It prints your lane's p99 and wasted callouts every second.

Open the Magnite kit and write-up →

Then a 2–4 week evaluation on one mirrored DSP response topic, alongside Kafka. **No advantage, no migration.**
