laserdata

Prepared for **Amagi**

Real-time ad beacons for Amagi THUNDERSTORM, on LaserData.

Every ad segment your stitchers serve reaches **the tracker that owns the session in milliseconds**, and every quartile beacon fires once, even when an event arrives twice or a tracker restarts. It runs beside Kinesis, so nothing else has to move.

One ad, two viewers,
as the event log sees it.
Now multiply by 42.4 billion a year.

```
21:14:00.004   ad.segment      sess-0418827  cr-117  segment 0 of 15  start point
21:14:00.009   beacon.start    sess-0418827  cr-117  fired  +5 ms  impression counted
21:14:14.009   ad.segment      sess-0418827  segment 7, sent twice  midpoint already fired
21:14:17.000   session.left    sess-0518302  after segment 8  no 75% or 100% beacon
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**THUNDERSTORM fires start and quartile beacons** from the server, and an impression counts when its beacon registers. **42.4 billion monetized impressions** in FY26 across SSAI and Ads Plus, up 62%. Tracker data goes to Kinesis, quartile URLs sit in Redis, sized for **2 million concurrent viewers**. (Tech blog, 2021; Q4 FY26 letter)
Where it fits	**The quartile tracker lane:** ad segments keyed by session into the tracker that owns it, each beacon fired once. Stitchers, Redis and Kinesis stay.
Next	**Amagi INTELLIGENCE agents** read the same lane over MCP, for break-level fill and delivery, with session, context and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Amagi: **100,000 viewers on 50 FAST channels**, everyone on a channel reaching the break together, viewers zapping away mid-ad, repeated events, a tracker restart and a Kinesis shadow bridge. It prints your lane's p99 and an audit of every beacon, every second.

Open the Amagi kit and write-up →

Then a 2–4 week evaluation on one mirrored tracker stream, alongside Kinesis. **No advantage, no migration.**
