laserdata

Prepared for **Kraken**

Real-time execution reports for Kraken's gateways, on LaserData.

Every order event reaches **every FIX and WebSocket gateway in milliseconds**, and a session that reconnects gets its missed fills replayed in order. It runs beside Kafka and Aeron, so nothing else has to move.

One FIX session drops for a second,
as the event log sees it.
Now multiply by every session.

```
14:02:05.610   exec.trade      AC0418207   seq 4182 BTC/USD buy 0.25 of 0.50
14:02:06.040   exec.filled     AC0418207   seq 4183 0.50 of 0.50, order closed
14:02:06.500   fix.logon       AC0418207   resend from seq 4182
14:02:06.506   gateway: 4182–4183 replayed from the log, PossDupFlag=Y · then live
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**FIX gateways replay ExecutionReports** from the sequence number a reconnecting session asks for. Tens of thousands of algorithmic connections, jitter under 30 ms through the FTX week, services event-driven on Kafka in Rust. (Kraken blog and API docs)
Where it fits	**The execution report lane:** order events keyed by account, read by every FIX and WebSocket gateway, replayed by offset on reconnect. The engine, Aeron and Kafka stay.
Next	**AI agents** that trade for customers read the same order events, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy, written in Rust like your services.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Kraken: **200,000 accounts at 15,000 execution reports a second**, gateways with sessions dropping and reconnecting, a volatile-market burst, a ledger export next door and a Kafka shadow bridge. It prints your lane's p99 and the reports replayed to reconnecting sessions, with gaps, every second.

Open the Kraken kit and write-up →

Then a 2–4 week evaluation on one mirrored execution feed, beside the engine and your gateways. **No advantage, no migration.**
