laserdata

Prepared for **Reddit**

Real-time ML safety signals for Reddit's REV2, on LaserData.

Every ML signal reaches the post it scores in milliseconds, so **REV2 gets the fully enriched post as soon as the last model scores it**. It runs beside Kafka and Flink, so nothing else has to move.

One post, three models,
as the event log sees it.
Now multiply by every post and comment.

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	ML services score content on their own, and inference is **much slower than a rule**. Signals-Joiner joins their signals to the preliminary stream in Flink windows; that wait delays the fully enriched stream, so REV2 reads both. You track join-rate (r/RedditEng, Aug 2024).
Where it fits	**The signal lane:** content and ML signals keyed by content ID. Each joiner owns a partition of every topic and sends the post on the moment its last signal lands, or without it after a wait limit. Kafka, REV2 and the models stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Reddit: **posts and comments with text, spam and media signals keyed by content ID**, late and missing signals, joiners that own their partitions, REV2's reader, a Time-Travel replay next door, and a Kafka shadow bridge. It prints p99 and join-rate every second.

Open the Reddit kit and write-up →

Then a 2–4 week evaluation on mirrored content and signal topics beside Kafka and Signals-Joiner, priced per billion events. **No advantage, no migration.**
