laserdata

Prepared for **SigNoz**

Burst-proof ingest buffering for SigNoz, on LaserData.

Every OTLP batch your collectors accept lands in **one durable log in milliseconds**, and ClickHouse writers drain it at their own pace. Bursts and ClickHouse stalls delay data by seconds and lose none. It runs between your collectors and ClickHouse, so nothing else has to move.

One export batch through a ClickHouse stall,
as the event log sees it.
Now multiply by every tenant.

14:03:10.050	clickhouse.insert	no confirmation, writer stops reading
14:03:12.418	otlp_logs.append	tenant-0042 batch 18231 100 records
14:03:22.140	clickhouse.insert	confirmed, 120,000 rows from the log
14:03:22.146	offset.commit	batch 18231 queryable, nothing lost

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	You are making **the ingest path robust to bursts while maintaining data freshness** (SigNoz job posts, 2026), and want queues that deliver **without loss** (signoz-otel-collector #182).
Where it fits	**The ingest buffer:** OTLP batches keyed by tenant, between gateway collectors and ClickHouse writers, committed after ClickHouse confirms. Exporters and schema stay.
Next	**AI agents** act on the same log, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for SigNoz: **200 tenants, 100,000 log records a second**, a real ClickHouse, a writer crash, a ClickHouse freeze, 20 agents reconnecting after 30 minutes and a Kafka shadow bridge. It prints freshness p99 every second and counts every record.

Open the SigNoz kit and write-up →

Then a 2–4 week evaluation on one mirrored otlp_logs topic, beside your current ingest path. **No advantage, no migration.**
