laserdata

Prepared for **ShareChat**

Real-time viewed posts for ShareChat and Moj feed dedup, on LaserData.

Every post a user has just seen reaches the dedup service **in milliseconds, so the next feed page never repeats it**. It runs beside Redpanda and WarpStream, so nothing else has to move.

One user, one scroll, one feed refresh,
as the event log sees it.
Now multiply by 8,000 feed requests a second.

20:41:08.402	posts.viewed	U048213377 · 5 posts · app flush
20:41:08.410	dedup.applied	seq 41 · +8 ms
20:41:09.310	feed.request	next page · 20 candidates · 2 just viewed
20:41:09.314	feed.dedup	2 removed → ranking · no repeats

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Viewed posts are sent periodically, queued and persisted, and that delay **"makes it possible to send duplicate posts in sequential feed requests"**. Logging moved to WarpStream, where ~1 s is fine. (2025 talks)
Where it fits	**The viewed-posts lane:** each app flush, keyed by user, read by the dedup service before the next page. Redpanda, Flink, ScyllaDB and WarpStream stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for ShareChat: **20 million users, 70,000 views and 8,000 feed requests a second**, a dedup step in front of ranking, an engagement stream next door and a Redpanda shadow bridge. It prints your lane's p99 every second.

Open the ShareChat kit and write-up →

Then a 2–4 week evaluation on one mirrored viewed-posts topic, beside Redpanda. **No advantage, no migration.**
