laserdata

Prepared for **Sony LIV**

Real-time KBC Play Along scoring for Sony LIV, on LaserData.

Every locked answer reaches its player's score **in milliseconds, on time and counted once, before the answer is revealed on TV**, even at a 1.6 million-player peak. It runs beside Kinesis, so nothing else has to move.

One player, one question, one lock,
as the event log sees it.
Now multiply by 1.6 million players.

21:14:06.000	show.open	E061-Q10 · Rs 5,00,000 on air · 5,000 points
21:14:13.412	answer.lock	PAP047120385 · B · 7.4 s after the open
21:14:13.418	scored	5,000 + 200 bonus · once · +6 ms
21:14:36.000	show.close	next question asked · later locks rejected
21:14:41.000	show.reveal	B · the player's score is already in

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	The KBC game peaked at **"1.6 million simultaneous users"** with **"sub-100 millisecond latency"** (AWS). Play Along answers are **"revealed on TV and App simultaneously"**, with 200 more points inside 10 seconds (KBC FAQ, 2025).
Where it fits	**The answer lane:** each lock, keyed by player, into its scorer, on time, once and before the reveal. Kinesis, ClickHouse and the app stack stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Sony LIV: **100,000 players, 80% locking each question, most inside the 10-second bonus**, late locks, app retries, an engagement stream next door and a read-only Kinesis bridge. It prints your lane's p99 every second.

Open the Sony LIV kit and write-up →

Then a 2–4 week evaluation on mirrored Play Along locks during KBC 18, beside Kinesis. **No advantage, no migration.**
