laserdata

Prepared for **Groww**

Real-time position updates for Groww Holdings, on LaserData.

Every fill's new position reaches the Holdings service **in milliseconds, so the refresh right after a trade shows the stock**, even at the 9:15 open. It runs beside your Kafka, so nothing else has to move.

One trade at the 9:15 open,
as the event log sees it.
Now multiply by millions a day.

09:15:02.318	order.executed	U04417203 · NSE-EQ-0137 · BUY 10
09:15:02.318	position.updated	U04417203:NSE-EQ-0137 · seq 3 · qty 15 → 25
09:15:02.330	holdings.applied	+12 ms · ETag invalidated
09:15:02.818	app.refresh	Holdings shows 25 shares · 488 ms to spare

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	The app refreshes Holdings right after the order update, leaving **about 500 ms** for the position update. At 1.5 s P99, bought stock went missing. (Groww Engineering Blog, Aug 2026)
Where it fits	**The position lane:** each fill's resulting position, keyed by user, read by the Holdings service. Strimzi Kafka, the changefeed and DataPlatform stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Groww: **3,000 fills a second with a 5× market-open burst**, a post-trade refresh check, a DataPlatform stream next door and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the Groww kit and write-up →

Then a 2–4 week evaluation on one mirrored position-update topic, beside your Strimzi Kafka. **No advantage, no migration.**
