laserdata

Prepared for **Measure**

Real-time crash spike alerts for Measure, on LaserData.

Every crash and ANR the ingest worker groups reaches the spike check in milliseconds, so **a spike alerts on Slack and email within a second**, not at the next hourly run. It runs on the Iggy server Measure already ships.

One crash spike,
as the event log sees it.
Your rule, checked on every batch.

10:04:12.530	ingest worker	first crash in 4.12.0 · CheckoutFragment.onResume
10:11:40.208	spike check	100 in the hour · 0.54% of 18,412 sessions
10:11:40.216	Slack, email	Crash Spike alert · a batch sent twice counted once
11:00:00.000	hourly job	would alert now · 48 min and 647 crashes later

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Crash and ANR spike alerts **run once an hour over the clock hour**: 100 occurrences of one issue and 0.5% of that hour's sessions. Ingestion already runs through Apache Iggy on self-hosted installs, Pub/Sub on Cloud. (measure-sh/measure, PR #3314, backend/alerts; Measure docs, Oct 2026)
Where it fits	**The crash spike lane:** one record per ingest batch after grouping, keyed by app, into a spike check with your thresholds and cooldown; alerts out to Slack and email. ingest-batch, ClickHouse and the hourly job stay.
Next	**Measure's Slack agent** explains each spike from the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Measure: **200 apps uploading 1,000 ingest batches/s**, a crash spike after a release, an ANR spike across the top of the hour, 1% of batches delivered twice, full ingest batches next door and a read-only shadow from ClickHouse. It prints the lane's p99 every second, and when Slack had each spike and when the hourly job would.

Open the Measure kit and write-up →

Then a 2–4 week evaluation on one self-hosted install, alongside the hourly job. **No advantage, no migration.**
