laserdata

Prepared for **DoorDash**

Real-time store feedback for DoorDash dispatch, on LaserData.

Every Dasher arrival, pickup and wait at the counter reaches the **dispatch coordinator in milliseconds**, before its next run, even on Super Bowl Sunday. It runs beside Kafka, so nothing else has to move.

One store on Super Bowl Sunday,
as the event log sees it.
Now multiply by every store.

```
18:42:04.118   order.picked_up    ST0041872  waiting 2 → 1 · waited 5.2 min
18:42:11.640   dasher.arrived     ST0041872  waiting 1 → 2
18:42:19.871   dasher.arrived     ST0041872  waiting 2 → 3 · market 75% busy
18:42:19.875   feedback.applied   coordinator  +4 ms
18:42:20.000   dispatch.decided   ST0041872  batch · weight 0.57
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Dispatch's RL agents shift **speed versus batching per store** from merchant congestion and courier utilization. The streaming fleet is moving to diskless brokers to cut cost. (DoorDash Engineering and job post, 2026)
Where it fits	**The store feedback lane:** Dasher assigned, arrived and picked up, keyed by store with the market's utilization, read by the dispatch coordinator. Kafka, Event Bus and Iguazu stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for DoorDash: **200,000 stores in 2,000 markets at 125 orders a second**, a 3× Super Bowl rush, client analytics flooding the same broker and a Kafka shadow bridge. It prints your lane's p99 every second.

Open the DoorDash kit and write-up →

Then a 2–4 week evaluation on one mirrored delivery-event topic, alongside Kafka. **No advantage, no migration.**
