laserdata

Prepared for **StubHub**

Real-time seat availability and prices for StubHub, on LaserData.

Every seller listing change reaches **event pages and checkout in milliseconds**, even in a big onsale. It runs beside Event Hubs today, and beside whichever broker you choose next, so nothing else has to move.

One listing on one event,
as the event log sees it.
Now multiply by every listing.

```
20:00:01.204   listing.repriced   E00731:L0004418   $185 → $172
20:00:02.517   listing.sold       E00731:L0004418   4 → 2 left
20:00:03.090   listing.sold       E00731:L0004418   2 → 0 left
20:00:03.094   event page: listing hidden, before the next seat pick
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**10–30B events a day** for ~100 teams, moving from Event Hubs and Service Bus to a Kafka-compatible platform on AWS. Supply SLAs hold at any seller load. (StubHub job posts, 2026)
Where it fits	**The listing lane:** tickets left and price per listing, keyed event:listing, read by event pages and checkout. Event Hubs, Service Bus and your broker choice stay.
Next	**AI agents**, like the StubHub app in ChatGPT, read the same live availability, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for StubHub: **2,000 events × 250 listings**, buyers picking seats, a 3× onsale, a clickstream flood and an Event Hubs shadow bridge. It prints your lane's p99 and seat picks rejected as already sold, every second.

Open the StubHub kit and write-up →

Then a 2–4 week evaluation on one mirrored listing stream, beside Event Hubs and inside your broker benchmark. **No advantage, no migration.**
