laserdata

Prepared for **Zomato**

Real-time kitchen state for Zomato, on LaserData.

Every accepted order and every Food Order Ready tap reaches the **food preparation time model in milliseconds**, even at New Year's Eve peak. It runs beside Confluent Cloud, so nothing else has to move.

One kitchen on New Year's Eve,
as the event log sees it.
Now multiply by every kitchen.

20:41:04.218	order.accepted	RES004217	cooking 3 → 4
20:41:19.640	order.accepted	RES004217	cooking 4 → 5
20:41:31.102	food.ready	RES004217	cooking 5 → 4 · FOR tap
20:41:31.106	feature.applied	FPT view	+4 ms
20:41:31.350	fpt.predicted	ORD-88412	19.0 min on 4 cooking

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	FPT is predicted for each order in real time from the kitchen's **running orders and last five completed ones**. Latency-sensitive topics run on Confluent Cloud. (Zomato blog; WarpStream, Aug 2026)
Where it fits	**The kitchen lane:** order accepted, Food Order Ready and pickup, keyed by restaurant, read by FPT features and dispatch. Confluent Cloud, WarpStream and Flink stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Zomato: **150,000 kitchens at 8,400 orders a minute**, a 3× rush, a benchmark replay next door and a Confluent Cloud shadow bridge. It prints your lane's p99 every second.

Open the Zomato kit and write-up →

Then a 2–4 week evaluation on one mirrored order-state topic, alongside Confluent Cloud. **No advantage, no migration.**
