laserdata

Prepared for **Affirm**

Real-time customer loan aggregates for Affirm checkout, on LaserData.

Every new loan, payment and dispute reaches **the customer's aggregate in the feature store in milliseconds**, so the checkout version check finds it current. It runs beside Kafka and Flink, so nothing else has to move.

One returning customer,
as the event log sees it.
Now multiply by every checkout.

09:14:01.260	loan.autopay_failed	U-4217733	overdue 0 → 1
09:14:02.118	loan.manual_payment	U-4217733	$85.00 · overdue 1 → 0 · counter 42
09:14:02.127	aggregate.stored	U-4217733	counter 42 · +9 ms
09:14:03.402	checkout.features	U-4217733	stored 42 = record 42 · served

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Your lending system of record publishes **a per-customer aggregate with a version counter**; the pipeline "targets under five minutes", and when the counter has moved, checkout recomputes from full history (about 1 read in 40). (Affirm Tech Blog, Oct 2026)
Where it fits	**The aggregate lane:** user-level aggregates keyed by customer into the online feature store. Kafka, Flink, the store and the version check stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Affirm: **500,000 returning customers, 400 loan events/s**, the checkouts that follow them, redelivered aggregates, your five-outcome comparison on both paths, a history backfill next door and a Kafka shadow bridge. It prints your lane's p99 and checkouts found current, every second.

Open the Affirm kit and write-up →

Then a 2–4 week evaluation on one mirrored aggregate topic, alongside Kafka. **No advantage, no migration.**
