laserdata

Prepared for **Roblox**

Real-time game server state for Roblox matchmaking, on LaserData.

Every join, leave, new server and shutdown reaches **every matchmaker's index in milliseconds**, so players land on servers with room, even in a Saturday thundering herd. It runs beside matchmaking and Kafka, so nothing else has to move.

One game server on a Saturday,
as the event log sees it.
Now multiply by every server.

10:00:00.212	server.join	S0412377	players 29 → 30 of 30, full
10:00:00.216	matchmaker.index	S0412377	seq 8841 applied
10:00:00.650	join.request	P7731904	same place, edge-07
10:00:00.652	matchmaker: S0412377 full, skipped · placed on S0412391		

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Every engine instance pushes its state** into the matchmaking index, which refreshes every place's state every few seconds. A Saturday update can bring a 10× jump in joins, across 24 edge data centers. (Roblox newsroom, 2023 and 2025)
Where it fits	**The server state lane:** players, capacity and open or shutting down, keyed by server, read by every matchmaker. The matchmaking service, QaaS and Kafka stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Roblox: **10,000 game servers in 24 edge data centers**, matchmakers that score them like the default configuration, a creator update with a 10× herd, an analytics neighbour and a shadow bridge. It prints your lane's p99 and joins sent to a full or closing server, every second.

Open the Roblox kit and write-up →

Then a 2–4 week evaluation on one mirrored server-state feed, beside the matchmaking index. **No advantage, no migration.**
