laserdata

Prepared for **Scopely**

Real-time team race progress for Scopely, on LaserData.

Every dice roll in a MONOPOLY GO! race reaches **its race owner, and every finish reaches every game server, in milliseconds**, even at race start. It runs beside DynamoDB and ElastiCache, so nothing else has to move.

One race, one finish,
as the event log sees it.
Now multiply by a million players.

```
09:41:07.218   race.roll     race-004127  team 2  p0041273  1,214 of 1,200 points
09:41:07.226   race.finish   race-004127  team 2  1st place  +8 ms
09:41:07.231   delivered     every game server  +5 ms
09:41:07.840   race.tap      race-004127  team 2  p0041271  held, team home  +0.6 s
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	MONOPOLY GO! peaks above **a million concurrent players** on 2,000+ game server hosts and drove **2.1 million DynamoDB writes a second**. When the race mini game starts, load **triples in about five minutes** and some tables go from zero to ~100,000 units a second. (AWS re:Invent 2025; AWS Database Blog, 2024)
Where it fits	**The race lane:** rolls keyed by race into one race owner, counted once on a client retry; laps, finishes and race ends out to every game server. DynamoDB, ElastiCache and the game server stay.
Next	**Live ops automation and AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Scopely: **2,800 races of 4 teams of 4** starting from zero, retried rolls, race owners, game servers reading every finish, analytics traffic next door and a DynamoDB Streams shadow bridge. It prints your lane's p99 and the players who rolled into a decided race, every second.

Open the Scopely kit and write-up →

Then a 2–4 week evaluation on one mirrored race table stream, alongside DynamoDB and ElastiCache. **No advantage, no migration.**
