laserdata

Prepared for **Shopify**

Real-time buyer signals for Shopify Inbox, on LaserData.

Every cart change and completed order reaches the merchant's conversation **in milliseconds, so the next reply sees what the buyer just did**. It runs beside your Kafka, so nothing else has to move.

One buyer, one order, one reply,
as the event log sees it.
Now multiply by Black Friday at 12:01 pm.

12:01:07.310	order_completed	B0072410388 · #1093 · $142.00 · cart cleared
12:01:07.316	conversation.event	seq 58 · "Order #1093 placed" · +6 ms
12:01:08.150	inbox.reply	Inbox agent · needs seq 58
12:01:08.151	inbox.reply.view	order placed · no discount code offered

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Live cart and order signals in Inbox lifted conversion **0.7 points**; the bar was **"low latency and high reliability"** (Shopify Engineering, 2021). Kafka peaked at **66M msgs/s** at BFCM 2024.
Where it fits	**The buyer signal lane:** cart and checkout events keyed by buyer, in order, into the conversation before the next reply. Kafka and Monorail stay.
Next	**AI agents** like the Inbox agent act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Shopify: **300,000 chatting buyers, 10,000 cart and checkout signals a second**, a 2× Black Friday surge, storefront events next door and a read-only Kafka bridge. It prints your lane's p99 and stale-cart replies every second.

Open the Shopify kit and write-up →

Then a 2–4 week evaluation on one mirrored buyer-signals stream, beside your Kafka. **No advantage, no migration.**
