laserdata

Prepared for **Disney+ / Hulu / ESPN**

Live watch signals for Disney+ and ESPN personalization, on LaserData.

Every start, switch and stop of a live game reaches the personalization features **in milliseconds, so the next Live rail matches what the viewer is watching**. It runs beside Kinesis, so nothing else has to move.

One profile, one switch, one Live rail,
as the event log sees it.
Now multiply by a full slate tipping off.

20:07:14.120	watch.switch	P031870442 · Lakers–Celtics → Rangers–Bruins
20:07:14.126	features.applied	seq 18 · +6 ms
20:07:15.040	rail.request	Live rail · 12 live events airing
20:07:15.043	rail.built	Watching: Rangers–Bruins · Back to: Lakers–Celtics

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Disney+ ingests **"billions of events per hour"** into Kinesis for real-time recommendations (AWS). ESPN is building real-time feature delivery for **"personalization and live sports experiences"** (job post, Oct 2026).
Where it fits	**The live watch signals lane:** each start, switch and stop, keyed by profile, read by the features before the next Live rail. Kinesis, Flink and the Event Platform stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Disney: **5 million profiles, 60 live events and 20,000 watch signals a second**, a 2× tip-off surge, client signals next door and a read-only Kinesis bridge. It prints your lane's p99 every second.

Open the Disney kit and write-up →

Then a 2–4 week evaluation on one mirrored watch-signal stream, beside Kinesis. **No advantage, no migration.**
