laserdata

Prepared for **MakeMyTrip**

Real-time last-searched hotels for MakeMyTrip, on LaserData.

Every hotel search, B2C and B2B, lands in the traveller's last-searched list **in milliseconds, before their next tap on the search bar**. It runs beside your Kafka and Spark, so nothing else has to move.

One traveller, one new hotel, one tap,
as the event log sees it.
Now multiply by a sale opening.

20:41:07.120	hotel.view	C0471203385 · B2C · Udaipur · after 4 Goa resorts
20:41:07.126	recents.applied	seq 23 · UDA00217 › GOA00388 › GOA00051 · +6 ms
20:41:07.520	searchbar.tap	needs seq 23
20:41:07.522	recents.served	1. Udaipur · UDA00217 · 2. Goa · GOA00388

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Last-searched hotels on Spark Real-Time Mode: p50 **1.23 s → 44 ms**, CTR **+7%**, p99 still **~500 ms**; B2C and B2B clickstreams merged on 64 Kafka partitions (Databricks, Apr 2026).
Where it fits	**The last-searched lane:** each hotel search keyed by user, B2C and B2B on one lane, in the list before the next tap. Kafka, Spark, Aerospike and Redis stay.
Next	**AI agents** such as Myra read the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for MakeMyTrip: **1,000,000 travellers and 10,000 hotel searches a second**, B2C and B2B on one lane, a 2× sale-opening surge, a clickstream next door and a read-only Kafka bridge. It prints your lane's p99 and stale last-searched lists every second.

Open the MakeMyTrip kit and write-up →

Then a 2–4 week evaluation on one mirrored hotel-search stream, beside your Kafka. **No advantage, no migration.**

The MakeMyTrip name identifies the intended reader only; no affiliation is implied. Facts are from the Databricks blog "How MakeMyTrip achieved millisecond personalization at scale with Databricks" (April 2026), co-written by MakeMyTrip's Associate Director of Engineering, and the matching Databricks customer story. The p99 of about 500 ms is MakeMyTrip's published end-to-end figure for the whole path; how much of it is the event stream is not public, and the 1-in-100 search shown is illustrative. Traveller, hotel IDs, list order and timestamps are illustrative.
