laserdata

Prepared for **Cursor**

Real-time spend limits for Cursor, on LaserData.

Every request's paid usage reaches **the spend-limit check, and every stop reaches every API server, in milliseconds**, even at peak. It runs beside WarpStream, so nothing else has to move.

One developer at their spend limit,
as the event log sees it.
Now multiply by every user at a limit.

```
14:22:07.398   usage.total     usr_04127  api-03  $199.87
14:22:07.412   usage.total     usr_04127  api-06  $200.06
14:22:07.416   limit.decision  usr_04127  STOP    +4 ms
14:22:07.419   stop applied    8/8 API servers, before the next request  +3 ms
```

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	Spend-limit **enforcement "is not instant, so usage can briefly exceed"** the limit. Billing owns usage events from the edge to Stripe, and metering lag. WarpStream runs the slower streams at ~500 ms. (Cursor docs, 2026; job post, 2026; WarpStream, 2025)
Where it fits	**The usage lane:** paid usage keyed by user into the spend-limit check, stops back to every API server. WarpStream, metering, the ledger and Stripe stay.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Cursor: **8 API servers, 20,000 users, 10,000 billable requests/s**, a spend-limit service with team, group and member limits, a traffic spike, a Tab-events flood next door and a WarpStream shadow bridge. It prints your lane's p99 and usage past the limit in USD every second.

Open the Cursor kit and write-up →

Then a 2–4 week evaluation on one mirrored usage topic, alongside WarpStream. **No advantage, no migration.**
