laserdata

Prepared for **Delhivery**

Real-time load checks for Delhivery's hub docks, on LaserData.

Every load scan and plan revision reaches **the load check, and every misload reaches the loader's handheld, in milliseconds**, before the next bag is scanned, even on a 6 million-shipment day. It runs beside MSK, so nothing else has to move.

One trailer, one wrong bag,
as the event log sees it.
Now multiply by every dock.

02:14:05.310	trip.plan	HSK-T0041273 · rev 2 · COK to another trailer
02:14:09.882	load.scan	HSK-T0041273 · BG204718339 · COK · L1
02:14:09.888	load.misload	COK not on the plan · loader's handheld · +6 ms
02:31:40.115	trip.sealed	HSK-T0041273 · 212 bags · CJB only

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**Handheld and sorter events** run through your Kafka on MSK (500+ topics, 300+ consumers). In FY26 you launched dock, yard and trailer management for faster loading of trucks in hubs. (AWS Big Data Blog; Annual Report FY26)
Where it fits	**The dock scan lane:** plans, load scans and seals keyed by trip, read by the load check and every handheld. MSK and the CDC pipeline keep the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for Delhivery: **1,000 docks loading at once**, plan revisions mid-load, a 3× festive peak, CDC into the data lake next door and an MSK shadow bridge. It prints your lane's p99 every second.

Open the Delhivery kit and write-up →

Then a 2–4 week evaluation on one mirrored dock scan topic, alongside MSK. **No advantage, no migration.**
