laserdata

Prepared for **MoEngage**

Real-time Smart Trigger events for MoEngage, on LaserData.

Each brand's trigger events get their own Apache Iggy topic and reach the campaign evaluator **in milliseconds, even while another brand runs a flash sale**. It runs beside your Kafka clusters, so nothing else has to move.

One brand's cart, another brand's sale,
as the event log sees it.
Now multiply by thousands of workspaces.

19:00:00.000	flash_sale.start	ws-0002 · 10× its quota · own topic
19:03:41.208	Added To Cart	ws-0117 · user u0041823 · seq 7
19:03:41.222	trigger.fired	ws-0117 · cart reminder · push · +14 ms
19:03:41.222	quota.held	ws-0002 · 412,000 events queued on its own topic

From the creators of APACHE IGGY

15×
faster P99 latency
than Apache Kafka

4×
higher throughput
than Apache Kafka

60–70%
lower infrastructure cost
compute, storage and network

Apache Iggy vs Apache Kafka, LaserData testing. Results vary by workload.

What you shared	**250B+ events a month**, peaks of 250K a second. Thousands of customers share a topic's partitions, and "Kafka itself can't support one topic per client at our scale". (MoEngage engineering blog)
Where it fits	**The Smart Trigger lane:** trigger events, one topic per workspace, keyed by user, read by the evaluator at each brand's quota. Kafka keeps ingestion, Samza, Flink and the rest.
Next	**AI agents** act on the same lane, with session, context, memory and replay from Laser SDK.
Underneath	**One durable event log.** LaserData, powered by Apache Iggy.

Try it in 15 minutes. Let the numbers decide.

A ready-made kit for MoEngage: **200 workspaces on their own topics**, a sharded trigger evaluator with per-brand quotas, a flash sale and the ingestion firehose next door, and a Kafka shadow bridge. It prints every brand's p99 every second.

Open the MoEngage kit and write-up →

Then a 2–4 week evaluation on mirrored trigger events for a set of workspaces beside Kafka, priced per billion events. **No advantage, no migration.**
